## Serverless Architecture Pros And Cons

Learn about the benefits and drawbacks of one of the hottest trends in IT today.

### Financial benefits

Not only do you theoretically reduce costs by eliminating the need to hire staff to support servers and other infrastructure, you can also save a great deal of money if your application traffic is extra bursty. In traditional server architectures, bursty traffic means that you must build your server to handle maximum burst rates. But the rest of the time, you are wasting money with idle CPU cycles. Instead of having to pay for that idleness, a serverless architecture lets you only pay for what CPU cycles you actually consume and code is only run when needed.
